

WireCAD Demo Project Instructions

This project is packed up with the global equipment database that was used during creation. In order to make it fully usable* in WireCAD use the Unpack Existing Project function: Project>Utilities> Unpack Existing Project... Browse to the .wcpj file in this folder. You will have an opportunity to rename the project. You will need to re-launch WireCAD to synchronize the global database.

NOTE: If you have customized your global equipment database, synchronizing with another global database can cause heartburn. Be sure to check your global Signal Types database and make sure that it is set to your presets.

*If you just want to view the drawings and databases in this project and do not plan to edit it in any way you can simply double-click the .wcpj file. This will open the project and ignore the sync functions. All of the equipment in the drawings will be orphaned until you sync with the global database.

Project Content

This project demonstrates an approach to security systems design. There are six drawings that detail access control, CCTV, and intrusion detection. All wires are labeled and a full equipment list and runsheet have been exported. Please feel free to call and ask any questions you may have about this project
